Law of Cosines

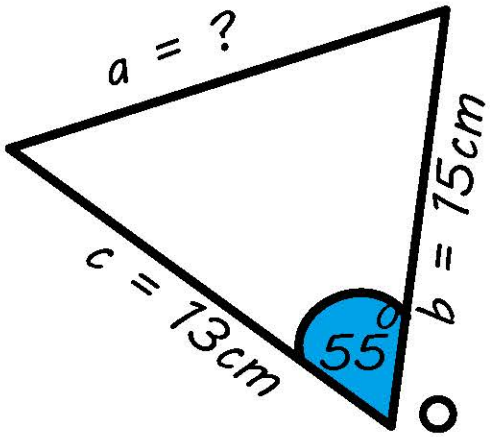
Finding sides

We can use the law of cosines when we know…

2 sides

1 angle Opposite the side we are trying to find.

For example…



We know 2 sides and the angle opposite the side we want to find, so we can use the cosine rule:

$$a^2 = b^2 + c^2 - 2bc\cos A$$

For this example…

$a^2 = 15^2 + 13^2 - (2 \times ___ \times ___ \times \cos 55^\circ)$

$a^2 = 170{\cdot}305\cdots$

$a = \sqrt{170{\cdot}305\cdots}$

$a =$ _____ (to 1 d.p)

The law of cosines can be rearranged to make either a, b or c the subject, or the angles, cosA, cosB or cosC

$a^2 = b^2 + ___^2 - 2bc \cos A$

$b^2 = a^2 + c^2 - 2ac \cos ___$

$c^2 = ___^2 + b^2 - 2ab \cos C$
